

Based on the two slides 22 and 23, I complete the table as follows:

Element	Construction/Creation		Use	
	Indicator	Social utility	Indicator	Social utility
Information resource	Number of documents published, links created, frequency of updates.	Knowledge sharing, information accessibility, online education.	Number of views, downloads, shares.	Dissemination of knowledge.
Structure	Number of links between pages, organization of sites.	Improved accessibility to information, more efficient navigation.	Browsing time, user journeys, number of clicks.	Optimal user experience, better connectivity between knowledge
Technology	Development of web based tools, new algorithms.	Automation of tasks.	Efficiency of algorithms, number of users.	Simplification of access to information.

This table effectively organizes key aspects of the web, but it could be improved by including more nuanced indicators, such as user engagement metrics or ethical concerns related to information accessibility and technology use. Additionally, the utilitarian perspective focuses mainly on benefits, without addressing potential drawbacks like misinformation or algorithmic biases.
